Earth and Space Science

Unit 3– Matter and Minerals (Ch. 2)

Defining a Mineral

 Mineral 1. Naturally occurring 2. Generally inorganic solid - Exception: calcite from animal shells 3. Solid Substance - Ice vs. Water; Mercury 4. Orderly chemical structure 5. Definite chemical composition that allows for some variation

Defining a Rock

 Rocks are aggregates (mixtures) of minerals Most rocks are aggregates of several different minerals - Granite Some rocks are composed of almost entirely of one type of mineral - Limestone

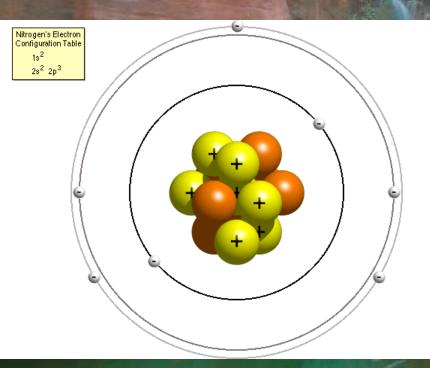

Composition and Structure of Minerals

- Elements
 - Basic building blocks of minerals
 - Over 100 are known

Composition and Structure of Minerals (cont.)

B. Atoms
1. Smallest particles of Matter
2. Have all the Characteristics of an element

How Atoms are Constructed

- A. Nucleus, which contains
 - 1. Protons positive electrical charges
 - 2. Neutrons neutral electrical charges (no charge)
 - 3. Only Protons & Neutrons are considered to have mass

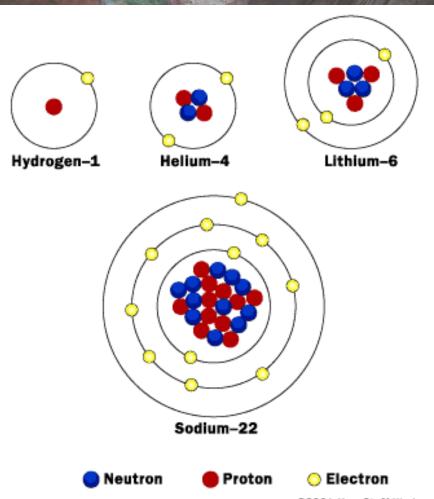

How Atoms are Constructed (cont.)

 Energy levels, or shells

 Surround nucleus
 Contain electrons – negative electrical charges
 Are considered to be massless

III. How Atoms are Constructed (cont.)

C. Atomic number is the number of protons in an atom's nucleus

C₆ Atomic Number = Z

III. How Atoms are Constructed (cont.) D. Bonding of Atoms Forms a compound with two or more elements Ions are atoms that gain or lose electrons

Ionic Bond (Sodium Chloride [table salt])

Sodium

Chlorine

Positive Charge

Negative Charge

Covalent Bond (Chlorine Gas)

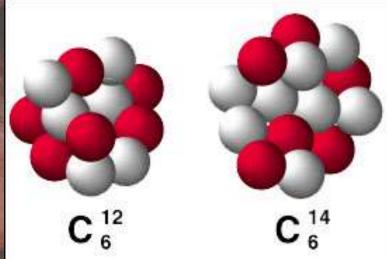

III. How Atoms are Constructed (cont.)

 Isotopes
 Have varying number of neutrons
 Have different mass numbers – the sum of the neutrons plus protons

E.

3. Many isotopes are radioactive and emit energy and particles

Mass Number = A

Atomic Number = Z

Phases of Matter

Solids - definite shape and volume Atoms are held close together by strong bonds Movement is slow Liquids - definite volume, but NO definite shape Bonds are weaker and atoms are spaced farther apart They take the shape of container they are in <u>Gases</u> - <u>NO</u> definite volume <u>OR</u> shape Bonds are weakest and atoms far apart Expand to fill the container they are in Examples - air, oxygen, smoke Plasma

- Gas like mixture of + and charged particles
- Movement very rapid
- 99% of mass of our solar system
 Examples: Sun, Stars and Lightning

IV. Properties of Minerals
A. Optical Properties
1. Luster
2. Color

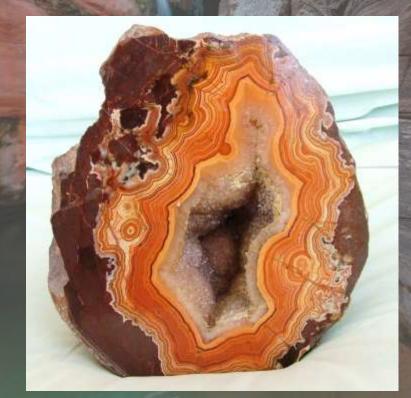

B. Crystal Shape, or Habit

Banded ►

C. Mineral Strength

Hardness
 Cleavage
 Fracture
 Tenacity

1	Talc	
2	Gypsum	scratched by fingernail
3	Calcite	scratched by coin
4	Fluorite	
5	Apatite	scratched by knife blade
6	Orthoclase	
7	Quartz	
8	Topaz	
9	Corundum	_
10	Diamond	harder than steel

D. Denisty & Specific Gravity

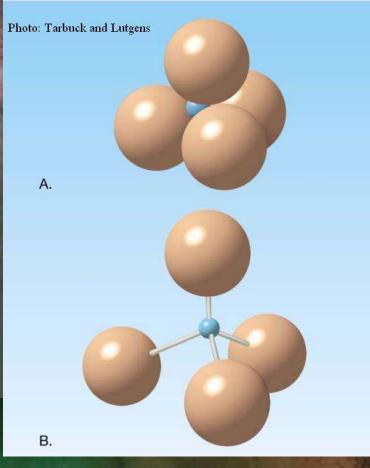

Specific Gravity Measurement

V. Mineral Groups

- Silicate minerals

 Most common mineral
 - group
 - a. Contain silicon-oxygen tetrahedron
 - b. Crystallize from molten material
 - c. Groups based upon tetrahedron arrangement

SiO tetrahedron

V. Minerals Groups (cont.) 2. Nonsilicate minerals Usually based on the negatively charged ion or complex ion that the members have in common. a. Major groups i. Oxides ii. Sulfides iii. Sulfates iv. Halides v. "Native" elements

VI. Natural Resources

A. Mineral resources
 Renewable vs. Nonrenewable

- 1. Reserves are already identified deposits
- Ores are useful metallic minerals that can be mined at a profit
- 3. Economic factors may change and influence a resource
