

A large waterfall cascading over rocks in a lush green forest. The water is white and frothy as it falls, surrounded by dense green foliage. The scene is captured from a low angle, looking up at the waterfall.

Earth & Space Science

Unit 4 Lecture 2: Running Water and Groundwater (Ch. 5)

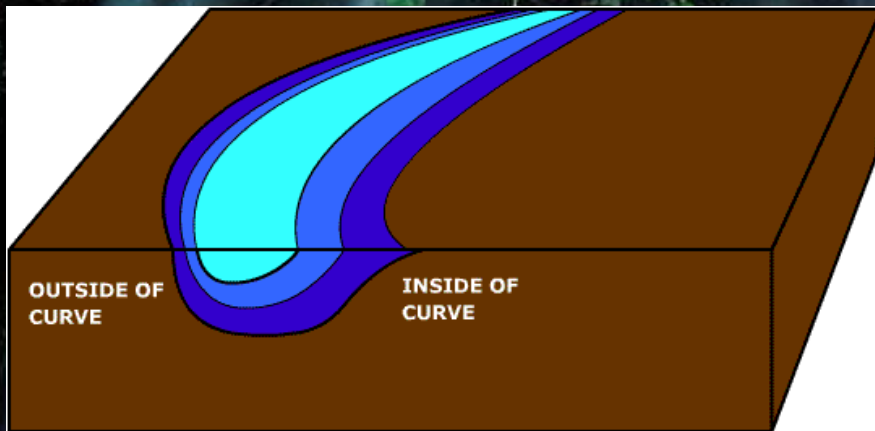

Distribution of Earth's Water

The Hydrologic Cycle

Stream Flow

Stream Flow (cont.)

◆ Gradient

– The slope of a stream from 'head' to 'mouth'

◆ 'head' or 'headwaters' is the beginning of the stream

◆ 'mouth' is the end of the stream

◆ Discharge

– The volume of water that is flowing down a specific point of the stream at a given time

Base Level

- ◆ Sea level is considered the ultimate base level
- ◆ Temporary, or local, base levels are considered to be:
 - Lakes
 - Resistant layers of rock
 - Main streams which act as base level for their tributaries

Base Levels (cont.)

Work of Streams

- ◆ Erosion
- ◆ Transportation: 3 ways
 1. In solution (dissolved load)
 2. In suspension (suspended load)
 3. Scooting or rolling along the bottom (bed load)

Work of Streams (cont.)

Work of Streams (cont.)

- The ability of a stream to carry a load is dependant upon 2 things:
 - ◆ Competence: maximum size of particles that a stream can carry
 - ◆ Capacity: the maximum load it can carry
- ◆ Deposition
 - The depositing of materials

Work of Streams (cont.)

Work of Streams (cont.)

Work of Streams (cont.)

◆ Narrow Valley

- Narrow “V” shaped valley
- Stream has been down cutting towards base level
- Predominate Feature is rapids

◆ Wide Valleys

- Energy is now side to side
- Floodplains, meanders, cutoff, oxbow lakes, and artificial cutoffs

Drainage Patterns

Dendritic

Rectangular

Fractures
